

Setting up a Zoho Creator account and exploring the platform architecture and interface.

AIM:

To set up a Zoho Creator account, create a sample application, explore the core platform architecture (Develop, Deploy, Manage), and understand its user interface components.

SETTING UP ZOHO CREATOR:

(i) Create the Sample Application

1. **Sign Up / Log In:** Navigate to the Zoho Creator website and sign up for a free trial or log into an existing Zoho account.
2. **Access the Dashboard:** Once logged in, click on the **+ Create Application** or **Create From Scratch** button on the main homepage.
3. **Application Details:** Name the application (e.g., "*Sales Tracker*" or "*Employee Directory*") and click **Create** to launch the low-code development workspace.

(ii) Component Explanations

1. Creating a Form

Explanation: A Form is the data collection engine of Zoho Creator. It utilizes a drag-and-drop interface containing various field types like text, numbers, dropdowns, and dates. When a user submits a form, the input data is validated and securely stored as a new record in the underlying database table.

2. Creating a Report

Explanation: A Report visualizes and organizes the raw data collected through your forms. It allows developers to present information in diverse formats such as lists, grids, Kanban boards, or calendars. Reports also support data manipulation features including advanced filtering, sorting, and conditional formatting.

Task name	Due Date	Priority	Status	Description	Auto Number
Software Version Update	09-Feb-2024	High	Completed	Awaiting IT department's schedule	1005
Inventory Check	31-Dec-2023	Medium	In-Progress	Scheduled for end of the month	1004
Plan Marketing Campaign	25-Jan-2024	Medium	In Review	Survey draft ready, needs approval	1003
Update Website Content	19-Jan-2024	Low	Yet to Start	waiting product details from team	1002
Finalise Quarterly Reports	21-Dec-2023	High	In-Progress	Draft completed, final review pending	1001

3. Creating a Dashboard

Explanation: A Dashboard (Pages) serves as an interactive canvas for executive summaries and analytics. It consolidates multiple forms, reports, custom buttons, and visual widgets like charts or KPIs into a single screen. This interface gives users a centralized, high-level overview of key business metrics in real-time.

EXPLORING THE PLATFORM ARCHITECTURE AND INTERFACE:

Develop

- The **Develop** environment provides a drag-and-drop canvas alongside Zoho's proprietary scripting language, Deluge, to build applications.
- Developers can visually design user interfaces, structure database tables through forms, and automate complex workflows without writing extensive code.
- It features built-in tools for input validation, conditional visibility rules, and instant live previews of the application layout across desktop and mobile devices.

Deploy

- The **Deploy** architecture automates the application lifecycle by instantly hosting the software on Zoho's secure cloud infrastructure.
- It eliminates the need for manual server configuration, database provisioning, or platform-specific compilation for mobile application environments.

- Updates and new features published by the creator are pushed to end-users instantly in real-time without causing application downtime.

Manage

- The **Manage** console gives administrators central control over user access, data security governance, and system maintenance.
- It features role-based access control (RBAC) to define exactly who can view, edit, or delete specific data records within the platform.
- The backend also tracks system activity logs, performance metrics, and handles third-party API integration connections seamlessly.
